

Module 1 - Lecture 17

File I/O Part 2

Review

- What are two types of errors?
- Checked vs unchecked exceptions.
- What is the mechanism we use to handle exceptional cases in our programs?
- How do we read files?

Buffers

- Write to disk as little as possible. It is expensive.
- Buffers for writing files are like buckets. They can hold data until they are filled. Then, they are emptied so they can be filled again.
- Data is held in a buffer in memory until it is flushed. Flushing the buffer will write the data to disk.

Let's Code!
